Network Schematic
For this month's report, I thought I would leverage all the time and energy that went into my initial documentation of our networking infrastructure. As the various contractors have been interacting with our network, it has become increasingly important that I have accurate and current information showing the main pieces of our network's infrastructure and the connections associated with each. The resulting document was a great deal of effort to establish initially, but now that it is complete, it is something like the "map" of our district network.

The sheet attached to this note is for your own interest as a physical product of our network overhaul. While I don't worry too much about "the bad guys" seeing what is listed. Even so, I don't really want to put it up on a website either. Even though one could ultimately determine that information no matter how careful we are, it just isn't good practice to make readily available a detailed map showing the address, type, model and location of your organization's key systems.
